

IN THE CLAIMS:

Please cancel Claims 53 to 55 and 60 to 68 without prejudice or disclaimer of subject matter. The remaining claims are listed below.

1. to 24. (Canceled)

25. (Previously Presented) An image processing method in a printing system receiving file data from an external terminal, converting the received file data to bit map image data by a plurality of processors, each processor performing a conversion process of an assigned job to bit map image data, and providing a plurality of pages of bit map image data in order to a printing engine, the printing engine printing the provided page of the bit map image data at a constant speed on a recording medium, the image processing method comprising the steps of:

receiving a page description language format of data including attribution information from the external terminal, the attribution information indicating at least a data structure of plural pages in the received data and type of objects which constitutes the page description language format data;

analyzing the attribution information included in the received page description language format data to segment a page into objects defined by the page description language format data;

independently assigning each object in the received page description language format data to a respective one of the plurality of processors as jobs of conversion

processes converting the object into image data to a completion of the conversion

processes for one page;

receiving bit map image data of each job from the plurality of processors without regard to a page order and storing the received bit map image data from the plurality of processors into a memory having a memory capacity for storing plural pages of bit map image data; and

reconstructing the bit map image data stored in the memory in page order to the printing engine.

26. (Original) An image processing method according to Claim 25, wherein, in a case of assigning one object to one processor, said assigning step selects one of the plurality of processors, which finishes a conversion process of the object to raster image data earlier than others.

27. (Original) An image processing method according to Claim 26, wherein each processor having a queue for storing assigned objects as jobs of conversion processes, and said assigning step assigns each object to one of the queues of the processors, and each processor performs the conversion process based on information of the job stored in the queue.

28. (Original) An image processing method according to Claim 27, wherein each queue includes information indicating estimation time required in completing

the assigned jobs by each processor, and wherein said assigning steps selects one of the plurality of processors, which the estimation time in the queue is shorter than others.

29. (Previously Presented) An image processing method according to Claim 25, wherein the printing system having a conversion unit converting, into bit map image data, file data other than the page description language format data, and

wherein, in a case where the file data received is other than the page description language format data, said analyzing step judges, based on attribution information included in the received file data, a format of the received data, and said assigning step assigns a job of the conversion process of the received file data to the conversion unit.

30. (Previously Presented) An image processing method according to Claim 29, wherein the file data is judged to be of a Graphic Display Interface (GDI) format by said analyzing step.

31. (Previously Presented) An image processing method according to Claim 29, wherein the file data is judged to be of an Extensible Markup Language (XML) format by said analyzing step.

32. (Previously Presented) An image processing method according to Claim 30, wherein the conversion unit includes a video-graphics processing unit processing

data for display, the video-graphics processing unit providing bit map image data of a predetermined size, and wherein the conversion unit divides a page of data in the file data into a plurality of segments, and converts the segment data into bit map image data, and said reconstructing step combines the bit map image data of the plurality of segments into the page of bit map image data.

33. (Previously Presented) An image processing method according to Claim 29, wherein the conversion unit assigns tag information into each segment data, and wherein said reconstructing step performs the combining process based on the tag information.

34. (Previously Presented) An image processing method according to Claim 25, wherein the printing system comprises a printing engine for continuously receiving color image data having at least three color components in page unit and for printing the at least three color components of color image data on a recording medium in parallel at a constant speed,

wherein said receiving step receives a page description language format of data including at least two of the at least three color components as at least an object constituting the page description language format data, and

wherein said assigning step divides the object of the at least two color components into each color component data, and assigns each color component data as an independent job to at least two of the plurality of processors so that the two processors

independently convert the at least two color component data into bit map image data of the at least two color components in parallel.

35. to 43. (Canceled)

44. (Previously Presented) A printer controller apparatus including a plurality of parallel developing means for developing print data into image data, comprising:

receiving means for receiving a plurality of pages of print data, said plurality of pages having a designated order;

generating means for generating a plurality of object data and a plurality of component data corresponding to each color component of the object data from each page of print data received from said receiving means;

first control means for controlling said plurality of parallel developing means, said first control means assigning said color component data and said object data generated by said generating means to said plurality of developing means according to the object data and to a respective type of said corresponding color component data, said plurality of parallel developing means generating image data from the color component data and the object data;

means for storing said image data generated by said plurality of parallel developing means independent of said page order; and

second control means for controlling output of said stored image data on a printing apparatus based on said page order.

45. (Previously Presented) A printer controller apparatus according to Claim 44, wherein said second control means controls output of said image data based on an ordering of colors to be outputted on said printing apparatus.

46. (Previously Presented) A printer controller apparatus according to Claim 44, wherein said generating means generates component data corresponding to a color component and an object by page.

47. (Previously Presented) A printer controller apparatus according to Claim 44, wherein said generating means divides each page into at least two objects and generates component data corresponding to a color component for each object.

48. (Previously Presented) A printer controller apparatus according to Claim 44, while at least one of said plurality of parallel developing means is processing component and object data of one page, said first control means assigns component and object data of another page to unused ones of said plurality of parallel developing means.

49. (Previously Presented) A printer controller apparatus according to Claim 44, wherein said receiving means receives print data for more than one print job, and

wherein while at least one of said plurality of parallel developing means is processing component and object data of one print job, said first control means assigns component and object data of another print job to unused ones of said plurality of parallel developing means.

50. (Previously Presented) A print controller apparatus according to Claim 44, wherein said plurality of parallel developing means is executed by one processing unit.

51. (Previously Presented) An image processing method according to Claims 25, wherein the assigning step further comprises segmenting the objects into color component data, so that a job is segmented into each set of object and color component.

52. (Previously Presented) An image processing method according to Claim 31, wherein the Extensible Markup Language (XML) formatted data is processed by an XML formatter, so that the XML data is converted to bit map image data.

53. to 68. (Canceled)
